POPULAR GAMES

ROBLOX

KLONDIKE ADVENTURES

RAFT SURVIVAL

Roblox It is the number one adventure game on both iPhone and iPad in Switzerland, and the number one adventure on Android in Switzerland, France, and Germany.
What makes it work is the massive user-created world, multiplayer social game, endless new content, and cross-platform access. The combination is abnormally powerful in Switzerland in that it promotes social play, as well as fast drop-in.

Klondike Adventures - It is found in the Swiss iPhone adventure chart (#4), and the Swiss iPad adventure chart (#12).
It is attractive because of its exploration, farming, building, quests, themed events, and a relaxing layer of mini-games; even the listing at the Swiss App Store displays German + 12 more languages, which is important in a multilingual market.

Raft Survival - is ranked in the Swiss iPhone adventure chart (#13), and the Swiss iPad adventure chart (#5).
it is about survival, crafting, collection of resources, dealing with hunger and thirst, and inquiry in a simple world that can be learnt within a short period of time.

Unique Selling Points

Social / shared play

Both Roblox and The Sims (another popular game) rely on friends, shared spaces, and identity of the user; Swiss players also tend to play with friends, family, or online communities.

Low-friction progression

Klondike and Raft ensure progress can be seen on the screen by constructing, crafting, quests, and upgrades, which suits a market that favors easy-to-play games and free-to-play business models.

New content all the time

Live events, themed updates and rotating challenges are a great retention factor in mobile games, and that is important in adventure games since players have to have an incentive to come back after brief games.

Common Themes

Sandbox / create-and-explore

Roblox is the most obvious example, but the same sense of building your own world can be found in The Sims FreePlay and Klondike.

Designing + creating

Klondike and Raft both revolve around loops of resources, building, and expansive growth.

Quest-based adventure

Swiss game overall remains dominated by low-entry free games such as memory, card, board, and puzzle games, and action/adventure is also a high core genre; therefore, hybrid adventure games with easy-to-reach objectives and smooth progression are a more favorable bet than dense hardcore development.

Player Demographics

Swiss gaming is extensive: 57% of people (3.6 million people) play games and 23% play on a daily basis. Smartphone is the most commonly played device and the demographic is divided by age and gender: men generally play more frequently than women though older women are the most active, and young men (15-19) are the most active daily. Language regionally, German speaking Switzerland (24%), then French speaking Switzerland (19%), then Ticino (15) have the highest numbers of daily gaming.

In the case of multilingual behavior, Switzerland is not a monolingual market two-thirds of the population speaks more than one language every day and English is widely spoken throughout the country, particularly among the younger generation. Federal Statistical Office also indicates that 86 percent believe that the knowledge of more than one national language is a factor in cohesion.

Play Environments

The Swiss people use approximately one and a half hours per day in travelling and a significant portion of these journeys is in Switzerland; the Swiss also possess a rich culture of using public transport. The likelihood of mobile-play windows is commutes, train rides, waiting times, and brief breaks. The mobility data is giving me the context of gaming, but it is a good fit to the daily life of Swiss people.

Session length & player behavior

The confirmed cleanest benchmark that I identified is the global average gaming-app session length of 30.75 minutes at Adjust in 2024.
An independent benchmark snippet of GameAnalytics indicates that Europe is significantly shorter, at 5.75 minutes per mobile-game session, so session metrics differ a great deal by approach and genre. Frequent short sessions that have a distinct starting point are the safest design assumption, rather than long sessions.

Live ops: Surprise events, rotating challenges, rewards and social mechanics are what keeps players coming back.
The things that drive them out are bugs, excessive complexity, early paywalls, repetition, and content that is exhausted.

Device Orientation & Controls

I was not able to confirm a Swiss survey that directly assesses portrait vs. landscape preference. Given the heavy presence of smartphones in the Swiss market and the high volume of commute time, I would consider portrait / one-handed play as the default and landscape as the special cases, combat, or more enriched exploration. In the case of multilingual UI, it implies brief text, customizable button sizes, secure margins, and a language switch, which does not disrupt the design.

Gaming Devices

The Swiss mobile devices base is presently domineering Apple-heavy: Apple 58.32, Samsung 24.47 with iOS 58.32 and Android 41.22 respectively. Design-wise it implies that your trilingual adventure game should be adjusted first to the new iPhones and then thoroughly reviewed on the mainstream Samsung and other Android devices.

Multilingual & Localization Aspects

Multilingualism is highly valued in Switzerland. The proportion of multilingual individuals in French-speaking Switzerland is the greatest, younger Swiss tend to combine more languages, and English is widely spoken in various regions.

In this market, the level of English + French + German at launch is the most viable; in case you can, allow players to toggle languages in settings and store text, tutorials, and live-event copy be completely localized.

Swiss-German is more of a culture layer of marketing or voice of character than of a UI language, since the written standard players required in apps are typically German.
